CHAPTER 1

Introduction to Purchase Order Processing

Understanding the Procurement Cycle in Infor LN

Purchase Order Processing is a core business function within the Infor LN Procurement module that manages the complete lifecycle of purchasing goods and services from suppliers. From creating a purchase requisition to receiving goods, inspecting quality, and processing supplier invoices, the procurement cycle touches every area of a manufacturing or distribution enterprise.

In Infor LN 10.5, purchase orders are managed through the TD (Trade & Distribution) module, specifically the PUR (Procurement) sub-module. The system provides a highly configurable, activity-based order procedure that can be tailored to match your organization's exact purchasing workflow.

Why Purchase Order Processing Matters

An efficient procurement process directly impacts material availability, production scheduling, cost management, and supplier relationships. Infor LN provides a structured framework that ensures every purchase follows organizational policies, approval workflows, and compliance requirements.

Module Architecture

The Procurement module in Infor LN integrates with several other modules to provide end-to-end purchasing capability:

Module	Integration Purpose
Common (TC)	Business partner master data, address management, currency and exchange rates
Item Data (TCIBD)	Item master information, units of measure, item groups
Warehousing (WHINH)	Inbound receipt processing, warehouse orders, put-away activities
Finance (TF)	Accounts payable, purchase invoice matching, financial postings
Enterprise Planning (EP)	Planned purchase orders, MRP-generated demands
Sales (SLS)	Direct delivery orders, back-to-back order processing
Quality (QM)	Incoming inspection, quality conformance, supplier ratings
Manufacturing (TI)	Subcontracting orders, outside operation processing
